1.6.4 Elective Track <i>Applied Quaternary Geology</i>	14
2. Module Overview	16
2.1 General Compulsory Modules.....	16
2.2 Compulsory Modules of the Elective Tracks	17
2.2.1 Compulsory Modules <i>Mineralogy and Geochemistry</i>	17
2.2.2 Compulsory Modules <i>Geomechanics and Tectonics</i>	17
2.2.3 Compulsory Modules <i>Geohazards</i>	17
2.2.4 Compulsory Modules <i>Applied Quaternary Geology</i>	18
2.3 Elective Modules Assigned to the Elective Tracks.....	19
2.3.1 Elective Modules <i>Mineralogy and Geochemistry</i>	19

2.3.2 Elective Modules <i>Geomechanics and Tectonics</i>	20
2.3.3 Elective Modules <i>Geohazards</i>	21
2.3.4 Elective Modules <i>Applied Quaternary Geology</i>	22
2.4 Further Elective Modules	23
3. Module Descriptions	24
3.1 General Compulsory Modules.....	25
3.1.1 Research Methods in Geosciences.....	25
3.1.2 Seminar and Colloquium I	27
3.1.3 Field Trips	29
3.1.4 Geographic Information Systems	31
3.1.5 Geological Project.....	33
3.1.6 Seminar and Colloquium II	35
3.1.7 Master Module.....	37
3.2 Compulsory Modules of the Elective Tracks	39
3.2.1 Compulsory Modules <i>Mineralogy and Geochemistry</i>	39
3.2.1.1 Analytical Methods I.....	39
3.2.1.2 Low-Temperature Geochemistry	41
3.2.1.3 Ore-Forming Processes	44
3.2.2 Compulsory Modules <i>Geomechanics and Tectonics</i>	46
3.2.2.1 Computing in Geosciences	46
3.2.2.2 Tectonics.....	48
3.2.2.3 Near-Surface Geophysics	50
3.2.3 Compulsory Modules <i>Geohazards</i>	51
3.2.3.1 Computing in Geosciences – see 3.2.2.1.....	51
3.2.3.2 Earthquakes and Tsunamis.....	52
3.2.3.3 Hazard, Risk, and Prediction.....	54
3.2.4 Compulsory Modules <i>Applied Quaternary Geology</i>	56
3.2.4.1 Engineering Geology and Geotechnics.....	56
3.2.4.2 Sedimentary Geology	58
3.2.4.3 Earth Management	60
3.3 Elective Modules Assigned to the Elective Tracks.....	62
3.3.1 Elective Modules <i>Mineralogy and Geochemistry</i>	62
3.3.1.1 Igneous Processes	62
3.3.1.2 Metamorphic Processes	64
3.3.1.3 High-Temperature Geochemistry	66

3.3.1.4 Analytical Methods II.....	69
3.3.2 Elective Modules <i>Geomechanics and Tectonics</i>	72
3.3.2.1 Petrophysics	72
3.3.2.2 Rock Mechanics.....	75
3.3.2.3 Planetary Dynamics	78
3.3.2.4 Impact Geology	80
3.3.2.5 Shock Waves in Rocks	83
3.3.2.6 Remote Sensing.....	85
3.3.2.7 Engineering Geology and Geotechnics – see 3.2.4.1	87
3.3.3 Elective Modules <i>Geohazards</i>	88
3.3.3.1 Mass Movements	88
3.3.3.2 Volcanology and Volcanic Hazards.....	90
3.3.3.3 Climatic Geohazards.....	92
3.3.3.4 Impact Geology – see 3.3.2.4	93
3.3.3.5 Engineering Geology and Geotechnics – see 3.2.4.1	93
3.3.4 Elective Modules <i>Applied Quaternary Geology</i>	94
3.3.4.1 Quaternary Research.....	94
3.3.4.2 Hydrogeology	96
3.3.4.3 Climatic Geohazards – see 3.3.3.3.....	98
3.3.4.4 Computing in Geosciences – see 3.2.2.1	98
3.3.4.5 Petrophysics – see 3.3.2.1	98
3.3.4.6 Rock Mechanics – see 3.3.2.2.....	98
3.4 Further Elective Modules	99
3.4.1 Experimental Geochemistry	99
3.4.2 Chemical Thermodynamics of Geomaterials	101
3.4.3 Mineral Physics.....	103
3.4.4 Geothermics and Geothermal Energy	105

1. General Information

This module guide provides information about the M.Sc. program *Geology*. The program offers an individual specialization to one of the four elective tracks, *Mineralogy and Geochemistry*, *Geomechanics and Tectonics*, *Geohazards*, and *Applied Quaternary Geology*, which reflect the main areas of geoscience research in Freiburg. The Master of Science (M.Sc.) is an internationally recognized degree, which can be completed within two years (four semesters) of study. English is the official language of instruction and communication. This guidebook aims at presenting the vision, structure, and content of the M.Sc. program and provides necessary details of the individual modules and courses.

1.1 Overall Profile

Following the development of Geosciences over the last decades, the education in the M.Sc. program *Geology* focuses first on contemporary methods more than on providing specific knowledge. It provides competences in the critical assessment of scientific literature, scientific writing, techniques of presentation and data handling. These rather general qualifications are not only essential for a scientific career but have also become increasingly important in many fields of professional activity.

Beyond these rather general aspects, the M.Sc. program takes into account the ongoing specialization in all fields of science by offering four distinct elective tracks of topical specialization. These are *Mineralogy and Geochemistry*, *Geomechanics and Tectonics*, *Geohazards*, and *Applied Quaternary Geology*. Beyond focusing on a specific field of Geosciences, these elective tracks also extend the competences of the students in direction of either laboratory-oriented work, field work, theory or modeling and data analysis. The elective tracks reflect the research areas of the involved groups to some extent, so that components of research can be integrated into teaching, and a high quality can be achieved.

1.2 University of Freiburg Geosciences: Why to Complete M.Sc. Studies at Freiburg?

The Institute of Earth and Environmental Sciences belongs to the Faculty of Environment and Natural Resources as part of one of Germany's leading universities. In recent years, the University of Freiburg has been ranked atop in research quality in Germany. The research and teaching interests of the groups contributing to the M.Sc. program cover a wide range of exciting topics in geosciences. The following sections provide an overview of the areas of geoscience research at the University of Freiburg.

1.2.1 Sedimentary Geology and Quaternary Research

The youngest part of the geological history, the Quaternary period, i.e., the last 2.6 Ma, was characterized by rapid environmental developments caused by naturally occurring climate change. Furthermore, humans increasingly had an impact on processes on the Earth surface. In the terrestrial realm, these changes have been recorded in a variety of archives such as peat deposits and lakes as well as by sediments deposited by water, ice or wind. Investigating these archives helps to decipher natural climate variability and its impact on sedimentary systems. In collaboration with archaeological sciences, it also helps to understand how the human race developed and adapted to changing environments in the past.

1.2.2 Structural Geology and Tectonics

Structural Geology and Tectonics are core subjects in geology. Methodology used at Freiburg ranges from classical field mapping in the Alps to quantitative modeling and from remote sensing to nano-scale investigations. Our specific field of research is to compare standard brittle deformation with fast, rate-dependent dynamic deformation. For this, we are running a 3000 kN triaxial loading frame and a Split-Hopkinson-Pressure Bar to determine the mechanical properties under quasi-static and dynamic loading conditions.

1.2.3 Impact Crater Research and Planetary Geology

Impact crater research is a young discipline in geosciences. At Freiburg we explore terrestrial impact craters by means of field surveying, drilling campaigns, and microstructural analysis of shocked rocks. Our interdisciplinary research is devoted to understand the dynamics of impact cratering and also includes remote sensing of craters on Earth and other planetary bodies and the application of a variety of experimental techniques. In this respect a close collaboration exists to the Fraunhofer Ernst-Mach-Institute (EMI) Freiburg.

1.2.4 Data Analysis and Numerical Modeling

Modeling of geo-processes has become a major field in geosciences in the previous decades. Our research in this field focuses on long and short-term processes at the Earth's surface, mainly erosion in combination with tectonic processes and mass movements. Concepts of nonlinear dynamics in the context of geohazards also play a major part in our research. As a third subdomain, there has been active research in developing new methods of data analysis.

1.2.5 Near-Surface Geophysics

The exploration of the shallow subsurface with particular regard to sedimentary environments, mass movements and hydrogeology is actually built up at Freiburg. As seismic methods are a main subject of the Karlsruhe Institute of Technology (KIT) as a partner in the

EUCOR network, our focus is on nonseismic methods (resistivity methods, ground-penetrating radar, and other electromagnetic methods).

1.2.6 Petrology and Evolution of the Lithosphere

Mineral assemblages and structures of rocks ultimately result from large-scale geological processes reflecting dynamics of the Earth. These processes include formation of ocean floor along mid-ocean spreading ridges, evolution of island arc systems and continental margins with their volcanic systems, or building of mountain ranges such as the Himalayas and the Alps. The wide range and continually changing pressure and temperature conditions cause chemical reactions in rocks that change their mineral associations, textures or produce partial melts. Our research includes a variety of subjects such as pressure-temperature conditions, magma production, differentiation and crystallization as principal tools to reconstruct the past and present processes occurring on Earth.

1.2.7 Mineral Resources

Enrichment and accumulation of metals in the Earth's crust is a prerequisite for economically important mineral resources. These metal reserves are basis for the needs of our society and modern technologies. The mineral deposits occur in diverse geological settings, ranging from mid-ocean spreading ridges through magmatic arcs to stable cratons, and have been forming throughout the Earth's geological history. Mineral exploration and geological interpretation employ a variety of microanalytical and imaging techniques that becomes increasingly essential tools in ore processing and metal extraction. Our research focuses on diverse magmatic and hydrothermal mineral deposit types, formation of their mineral associations and metal endowment including high-tech and critical metals.

1.2.8 Geochemistry of Water, Crustal Fluids and Water-Rock Interaction

The chemical interaction of water and rock is one of the most universal, yet complex processes in geology. The composition of surface and ground water is largely controlled by the reaction of water with rocks and minerals. At elevated temperatures, the intensity and rates of these interactions are even greater and they lead to diverse economically important systems – hydrothermal ore deposits, geothermal energy reservoirs or sites for sequestration and deposition of greenhouse gases. Understanding water-rock interaction is thus of great importance to applied geology and geochemistry, particularly in areas such as geothermal energy, applied hydrogeology, water chemistry or nuclear waste disposal.

1.2.9 Classical Growth of Semiconductor Crystals

Semiconductor materials like silicon, lead iodide, and cadmium telluride are of high importance in a number of industries like the computer industry. Relevant physical properties of such materials are often only achieved if the required semiconducting building blocks are cut from large single crystals of the corresponding chemical element or compound. We

optimize conditions for the growth of such crystals, a growth which usually takes place at high temperatures in special furnaces. Close collaborations exist with the Fraunhofer Institute for Solar Energy Systems (ISE), the Fraunhofer Institutes for Applied Solid State Physics (IAF) and for Physical Measurement Techniques (IPM).

1.2.10 Crystal Growth in External Fields

To improve the quality of our application-relevant semiconductor crystals with respect to purity and position-independent structural uniformity, we investigate crystal growth also in external fields. These may be stationary or rotating magnetic fields or “Gravity fields” like under microgravity. In the latter case experiments are undertaken in space in special (manned) planes, (unmanned) rockets or (in the future) in the ISS (international space station).

Apart from working in close collaboration with the University of Freiburg Division of Chemistry, the department has close connections to the Freiburg Center for Materials Research (FMF), the Fraunhofer Institute for High-Speed Dynamics (Ernst-Mach-Institut EMI), the Fraunhofer Institute for Solar Energy Systems (ISE), the Fraunhofer Institute for Applied Solid State Physics (IAF), as well as the Fraunhofer Institute for Physical Measurement Techniques (IPM). All these institutions and facilities can be accessed within walking distance.

1.3 Analytical Facilities for Modern Quantitative Geosciences

The institute hosts advanced analytical facilities for research and teaching in the geosciences for both laboratory and field work. Besides a sample preparation laboratory for crushing and sieving as well as mineral separation and preparation of high-quality polished thin sections from geological or synthetic materials, the institute runs a 3000 kN triaxial loading frame for determination of static mechanical properties of solid rocks and a Split-Hopkinson bar for analyzing the behavior at rapid deformation. The kinematics of gravity-driven mass movements are studied in an analogue laboratory equipped with particle image velocimetry and stereo cameras.

The Quaternary research group operates a fully equipped laboratory for luminescence dating. Available geophysical devices include geoelectrics and ground-penetrating radar.

For the structural and chemical characterization of natural rocks and synthetic products two scanning electron microscopes equipped with EDX and an electron backscattered detector (EBSD), an electron microprobe, a WD-X-ray fluorescence spectrometer, and several optical microscopes are used. White-light interferometry is applied for the characterization of surface topographies. Atomic absorption spectroscopy, ion chromatography, and UV-VIS spectrometry are used for the analysis of fluids.

The structure of crystals – from the millimeter down to the picometer scale – can most effectively be investigated using X-ray methods. We use these methods to detect

imperfections or inhomogeneities in a crystal (X-ray topography), to measure with highest precision the so-called lattice parameters (high-resolution X-ray diffractometry), to determine accurately the arrangement of the atoms in the crystal (X-ray single crystal diffractometry), or to identify the components of a crystal powder, e.g. a mineral powder (X-ray powder diffractometry). Trace element concentrations in natural waters, soils, and other materials can be analyzed with our atomic absorption spectrometry (Flame AAS and Graphite Furnace AAS) and other equipment (UV-VIS, IC, CSH₂O-Determinators).

With our equipment for differential thermal analysis and differential scanning calorimetry we are able to study phase transitions, for instance melting or solidification, or the transition of a certain atomic arrangement in the crystals of a compound into a different arrangement (polymorphic transition) with respect to transition temperatures or transition enthalpies. Thermogravimetry is used to monitor quantitatively weight changes, which are, e.g., caused by thermal decomposition processes leading to new chemical compounds.

1.4 Application for the M.Sc. Program Geology

The application procedure for the graduate program is available online (<http://portal.uni-freiburg.de/master-geo/prospectivestudents/application>). The annual application deadline is May 15. Students can register for the fall semester only (starting mid' October). The M.Sc. Geology program is accessible to all students who have acquired a B.Sc. in Geology, Geosciences, Earth Science, or Mineralogy from a German university, or from other universities and colleges worldwide (in accordance with certain quality control criteria). Students holding a B.Sc. degree in other natural or physical sciences (Chemistry, Physics, Biology, Environmental Science) may also be granted admission to the program. In the latter case, the choice of the elective track may be determined from the student's educational background. Applicants must have English-language skills that meet or exceed level B2 of the Common European Framework of Reference for Languages (see the application form for details).

Questions concerning the general application and admission procedure to the M.Sc. Geology program should be addressed to the Application and Admission Coordinator, Ms. Alexandra Wicke and/or to the Academic Advisory Officer, Dr. Heike Ulmer. Ms. Alexandra Wicke is also the first contact for organizational enquires concerning the course of study.

1.5 Advising and Contact Points

If you have any questions regarding the content of your studies or application, the Academic Advisory Officer or the Head of the Geology Program will be happy to help you with advice and ideas. Consultation hours are arranged on a personal basis:

- **Student Advisory Support**

Dr. Heike Ulmer, Albertstr. 23-B, 2nd floor, room 02 014
Tel. +49 (0)761/203-6480; ulmer@uni-freiburg.de

- **Head of the Geology Program**

Prof. Dr. Stefan Hergarten, Albertstr. 23-B, 1st floor, room 01 011
Tel. +49 (0)761/203- 6471; stefan.hergarten@geologie.uni-freiburg.de

Questions concerning the general application and admission procedure should be addressed to the Application and Admission Coordinator:

- **Application and Admission Coordinator**

Ms. Alexandra Wicke, Albertstr. 23-B, 1st floor, room 01 020
Tel. +49 (0)761/203-6398; studienkoordination@geologie.uni-freiburg.de

If you have any questions about schedules of lectures, practicals and exams, please contact the Program Coordinator available during the opening hours and also by appointment:

- **Geology Program Coordinator:**

Ms. Alexandra Wicke, Albertstr. 23-B, 1st floor, room 01 020
Tel. +49 (0)761/203-6398; studienkoordination@geologie.uni-freiburg.de

The study office provides information on field trip days achieved and the excursion modules posted on the transcript:

- **Excursion Module Coordinator Geosciences:**

Ms. Ilona Chudotvorova, Albertstr. 23-B, 1st floor, room 01 020
Tel. +49 (0)761/203-6398; studienkoordination@geologie.uni-freiburg.de

Questions about registration for examinations and Transcripts of Records should be addressed to the Examination Office:

- **Examination Office**

<http://www.unr.uni-freiburg.de/fakultaet/pruefungsamt>;
Albert-Ludwigs-Universität, Prüfungsamt der Fakultät für Umwelt und natürliche Ressourcen, Tennenbacherstr. 4, D-79085 Freiburg

The Credit Recognition Officer will answer questions regarding the recognition of achievements from abroad, other courses of study or other universities. Questions about the possibilities of a semester abroad are answered by the Study Abroad Coordinator of the geosciences:

- **Credit Recognition Officer Geosciences:**

Prof. Dr. Stefan Hergarten, Albertstr. 23-B, 1st floor, room 01 011
Tel. +49 (0)761/203- 6471; stefan.hergarten@geologie.uni-freiburg.de

- **Study Abroad Coordinator Geosciences:**

Prof. Dr. David Dolejš, Albertstr. 23-B, 1st floor, room 01 016

Tel. 0761/203-6395; david.dolejs@minpet.uni-freiburg.de

1.6 Structure of the M.Sc. Program Geology

The M.Sc. program Geology (see Fig. 1) includes 120 ECTS¹ points and is offered in English. To ensure high standards of teaching in an international academic setting, the program has been certified by the Language Teaching Institution of the University of Freiburg ("Sprachlehrinstitut") in 2016 with the EMI (English Medium Instruction) quality certificate.

The M.Sc. curriculum comprises six compulsory modules contributing 30 ECTS points compulsory for all elective tracks (blue in Fig. 1, for details see Sect. 2.1), while the remaining 90 ECTS points can be acquired according to the specific interests of the students to some degree. In order to achieve a specific, but balanced portfolio of qualifications, each student must select one out of the following four elective tracks:

- Mineralogy and Geochemistry
- Geomechanics and Tectonics
- Geohazards
- Applied Quaternary Geology

Each of these elective tracks comprises three compulsory modules (15 ECTS points, see Sect. 2.2). Beyond these compulsory modules, several specific electives are offered within each elective track (see. Sect. 2.3).

A total of 45 ECTS points is contributed by elective modules. In general, each module of this program can be used as an elective, except for those modules that are compulsory either for the overall program or for the selected elective track. The following further rules apply to the choice of electives:

- At least three modules must be taken from the catalog of modules explicitly assigned to the selected elective track (see Sect. 2.2, also marked with an E in the module description).
- Modules with a total amount of up to 15 ECTS points may be taken from other programs of the Albert-Ludwigs-University and its partner universities in the EUCOR network. These modules must be graded and considered as appropriate in the context of the M.Sc. program Geology, so that students must apply for such electives before

¹ „ECTS“ stands for "European Credit Transfer and Accumulation System" and is a uniform European system for the evaluation of academic achievements, which credits the amount of work done (30 hours per point) in the form of points (credits).

starting the module. It is recommended to ask the Credit Recognition Officer/Head of Geology Program for assistance.

- Up to 5 out of the 15 ECTS points mentioned in the previous point can be covered by language courses offered by the Language Teaching Center of the University (SLI). In contrast to all other electives, these are unmarked.

The grade of a module is derived from the module examination. This module examination may be a single written or oral examination at a given time, but the majority of the modules uses more specific formats to test whether the required qualifications have been achieved. These examinations may consist of several components (e.g., regular homework and a seminar presentation) but are graded as a whole (by adding scores of the individual parts), so that the students are in principle free to choose how much effort they spend for each part. Details about the weighting are provided in the module descriptions (Sect. 3). Within some of the modules, ungraded academic achievements may also be required, which are the prerequisites for the successful completion of a module.

In analogy to cheating in written or oral exams, copying another student's work, copying from literature or web sources without reference or using illicit materials is considered as academic misconduct in all components of exams (homework, reports, etc.). It leads to the loss of the entire score for the respective component of the module examination.

The modules use a combination of different forms of teaching and learning, such as small group work, scientific discussions, practical laboratory trails, theoretical exercises as homework, etc. The program is characterized by a balanced combination of theoretical basics, laboratory courses, practical training and field work.

The Master's thesis covers the handling of a scientific topic, as well as the presentation of the results and interpretation within the scientific framework. The Master's thesis aims to show that the students are able to familiarize themselves with a current geoscientific topic within the given period of six months, to use the methods and concepts learned and to present the results in an understandable form. It contributes 30 ECTS points.

1.6.1 Elective Track *Mineralogy and Geochemistry*

The elective track *Mineralogy and Geochemistry* offers education and research training in mineralogy, petrology, geochemistry, and mineral resources. The course curriculum is designed to extend foundations of petrology (metamorphic and magmatic processes, mineral transformations, properties of silicate magmas) and geochemistry (planetary differentiation, processes in the Earth's interior, oceans and surface). These foundations are followed by advanced courses leading to the formation of mineral resources, ore deposits as well as fluid-rock interaction in deep, geothermal and near-surface environments. The curriculum is complemented by practical modules that develop competence in laboratory analytical and

experimental methods. Thesis projects are designed to acquire deeper understanding of geological processes through field observations, interpretation of mineral assemblages or experimental studies in laboratory. These approaches, together with phase equilibria and thermodynamic modeling, are used to interpret various metamorphic, magmatic or hydrothermal processes occurring on the Planet Earth as well as those leading to the formation of economic mineral resources. The compulsory specialization modules are highlighted in green in the following chart (Fig. 1). The elective track *Mineralogy and Geochemistry* offers a sound education in analyzing, modeling, and understanding of geologic materials and processes, bridging the gap towards material sciences, and opening a wide field of career options in research and applied industries.

1.6.2 Elective Track *Geomechanics and Tectonics*

The elective track *Geomechanics and Tectonics* provides the student with a sound theoretical as well as practical knowledge in the respective fields of rock mechanics, petrophysics, geophysics, tectonics and the gained qualifications offer a wide spectrum of career choices, e.g. in the mining industry, subsurface investigations, geological surveys. Practical expertise includes work in the rock mechanics laboratory that hosts a triaxial loading frame, Split-Hopkinson Pressure Bar, and Analogue Laboratory. Geophysical and petrophysical equipment comprise of a He-pycnometer, laser-sizer, white light-interferometer, optical and electron microscopy, and devices for seismic, ground-penetrating radar, and geoelectric analyses. Note that the modules *Rock Mechanics* and *Petrophysics* are offered biannually alternating in the winter term. The elective track also offers a planetary focus direction with the modules *Planetary Dynamics* and *Impact Geology* that are also offered biannually.

1.6.3 Elective Track *Geohazards*

Quantification and prediction of geohazards has become a major field of both research in geoscience as well as of professional activity of geoscientists. The elective track *Geohazards* provides a comprehensive coverage of the most relevant geohazards including the underlying physical processes, their relationship to geology, assessment of hazard and risk, as well of concepts of prediction. The specific geohazards considered in this track comprise those with a close relationship to geology (volcanism, earthquakes, tsunamis, landslides, meteorite impact) as well as hazards receiving an increasing interest due to their potential relationship to climate change (e.g., storms, floods and various types of mass movements). As modeling has become an essential part in hazard assessment, numerical modeling approaches are also an essential component of the program. The elective track *Geohazards* consists of the compulsory and elective modules are marked by a light orange color in Fig. 1.

1.6.4 Elective Track *Applied Quaternary Geology*

Wide parts of the Earth surface are covered by Quaternary deposits, in particular the densely populated areas along rivers, coasts and on most plains. As a consequence, a large number of projects in applied geology are linked to Quaternary deposits. However, since most Quaternary deposits are unconsolidated, they differ significantly with regard to their properties and distribution compared to hard rock. The applied fields covered in the elective track *Applied Quaternary Geology* include hydrogeology, engineering geology, geotechnics, rock properties, environmental geosciences as well as the recognition of and the protection against natural hazards. To some extent, regulatory frameworks and economic aspects will be discussed during the courses. These topics are complemented by two modules focusing on how sediments are formed and on the environmental context during the Quaternary, a time that is characterized by massive and abrupt changes in climate. The elective track *Applied Quaternary Geology* consists of the compulsory and elective modules are marked by a dark orange color in Fig. 1.

2. Module Overview

2.1 General Compulsory Modules

Module	Coordinator	Courses	Type	ECTS points	Sem.
Research Methods in Geosciences	Preusser	Research Methods in Geosciences	L + P + S	5	1
Seminar and Colloquium I	Poelchau	Research Seminar	S	3	1 + 2
		Geoscience Colloquium	C	2	
Field Trips	Ulmer	Field Trips and Visits to Industrial Facilities	F	5	1 to 4
Geographic Information Systems	Wulf	Geographic Information Systems	L + P	5	2
Geological Project	Preusser	Geological Project	P	5	2, 3 or 4
Seminar and Colloquium II	Poelchau	Research Seminar	S	3	3 + 4
		Geoscience Colloquium	C	2	
Master Module	Hergarten		MT	30	4

Semester numbers indicate recommended semester

Abbreviations: L = Lecture, S = Seminar, C = Colloquium, P = Practical Course, F = Field Course, MT Master Thesis

2.2 Compulsory Modules of the Elective Tracks

2.2.1 Compulsory Modules *Mineralogy and Geochemistry*

Module	Coordinator	Courses	Type	ECTS points	Sem.
Analytical Methods I	Müller-Sigmund	Analytical Methods I	L + P	5	1
Low Temperature Geochemistry	Siebel	Marine Geochemistry	L + P	2.5	2
		Isotope Geochemistry	L + P	2.5	2
Ore-Forming Processes	Dolejš	Ore-forming Processes	L + P	5	2

Semester numbers indicate recommended semester

Abbreviations: L = Lecture, S = Seminar, C = Colloquium, P = Practical Course, F = Field Course

2.2.2 Compulsory Modules *Geomechanics and Tectonics*

Module	Coordinator	Courses	Type	ECTS points	Sem.
Computing in Geosciences	Hergarten	Computing in Geosciences	L + P	5	1
Tectonics	Kenkmann	Tectonics	L + P + S	5	2
Near-Surface Geophysics	Wilk	Near-Surface Geophysics	L + P	5	2

Semester numbers indicate recommended semester

Abbreviations: L = Lecture, S = Seminar, C = Colloquium, P = Practical Course, F = Field Course

2.2.3 Compulsory Modules *Geohazards*

Module	Coordinator	Courses	Type	ECTS points	Sem.
Computing in Geosciences	Hergarten	Computing in Geosciences	L + P	5	1
Earthquakes and Tsunamis	Hergarten	Earthquakes and Tsunamis	L + P	5	2
Hazard, Risk, and Prediction	Hergarten	Hazard, Risk, and Prediction	L + P	5	3

Semester numbers indicate recommended semester

Abbreviations: L = Lecture, S = Seminar, C = Colloquium, P = Practical Course, F = Field Course

2.2.4 Compulsory Modules *Applied Quaternary Geology*

Module	Coordinator	Courses	Type	ECTS points	Sem.
Engineering Geology and Geotechnics	Preusser	Introduction to Engineering Geology	L	2.5	2
		Geotechnical Projects	S	2.5	
Sedimentary Geology	Preusser	Sedimentary Environments	L	3	2
		Logging Sediments	P	2	
Earth Management	Preusser	Earth Management	L + S	5	3

Semester numbers indicate recommended semester

Abbreviations: L = Lecture, S = Seminar, C = Colloquium, P = Practical Course, F = Field Course

2.3 Elective Modules Assigned to the Elective Tracks

2.3.1 Elective Modules *Mineralogy and Geochemistry*

Module	Coordinator	Courses	Type	ECTS points	Semester
Igneous Processes	Dolejš	Igneous Processes	L + P	5	1 or 3
Metamorphic Processes	Dolejš	Metamorphic Processes	L + P	5	1 or 3
High Temperature Geochemistry	Siebel	Geochemical Evolution of the Mantle and the Crust	L + P	2.5	1 or 3
		High-Temperature Geochronology	L + P	2.5	
Analytical Methods II	Müller-Sigmund	Special Methods in Mineralogy	L + P	2	2
		High Resolution Spectroscopy	L + P	3	

Semester numbers indicate recommended semester; modules marked with “1 or 3” may be offered only biannually

3. Module Descriptions

Remarks on examinations in the module descriptions

Oral examinations, such as "oral presentations", "poster presentations", have a duration of at least 10 minutes and a maximum of 30 minutes per candidate according to the applicable framework examination regulations. If specifications that are more concrete have been made, these are stated in the individual module descriptions.

The duration of written exams is at least 60 minutes and maximum 240 minutes according to the applicable framework examination regulations. If specifications that are more concrete have been made, these are stated in the individual module descriptions. The dates for exams as well as the valid aids will be announced to the students in a timely manner.

3.1 General Compulsory Modules

3.1.1 Research Methods in Geosciences					
Module Coordinator Prof. Dr. F. Preusser		Lecturer(s) Prof. Dr. F. Preusser, Dr. L. Fischer			
Type C	Workload 150 h	Credits 5 ECTS	Term WS	Cycle annual	Duration 1 term
Course Research Methods in Geosciences		Presence 4 wh / 60 h	Private study 90 h		Participants 20

Abbreviations: C – compulsory, wh – week hours

The foundation of scientific work are skills and methods such as the correct way to work with scientific resources and databases, the analysis and critical review of the work of others, the analysis and interpretation of data, and the presentation of data and scientific results. In this module advanced scientific working skills and methods are introduced. By this, it forms the basis of the entire curriculum.

After this module, the students will understand how scientific articles and reports are structured. They will know about different publication platforms. Approaches how to organise and perform own communications will be trained.

Syllabus

Students will learn how scientific research and applied studies are initiated, funded and carried out. They will be trained in the usage of general scientific databases as well as specific geological databases, and how different publications can be accessed. Students will be instructed in the three essentials of scientific knowledge sharing: scientific papers, scientific posters and scientific presentations. Moreover, the critical analysis and review of papers and presentations is a key learning outcome. Additionally, students will become familiar with how scientific data should be processed and statistically analyzed and how the results of such analyses are presented in the form of scientific graphs. Finally, students are instructed on how to write a thesis.

Teaching form

Lecture, seminar, and practical

Examination form

Achievement of learning goals (unmarked): Regular attendance in the seminar and in the practical part

Examination: Written exam (30 %, 45 minutes), oral presentation (10 %), and project reports (60 %)

Prerequisites for attending

Usage of the module in other programs

Recommended reading

Variable, depending on the seminar topics

3.1.2 Seminar and Colloquium I

Module Coordinator Dr. M. Poelchau		Lecturers ---			
Type C	Workload 150 h	Credits 5 ECTS	Term WS/SS	Cycle annual	Duration 2 terms
Course a) Research Seminar b) Geoscience Colloquium		Presence a) 2 wh / 60 h b) 2 wh / 60 h (30 h each term)	Private study a) 30 h b) 0 h		Participants a) 40 b) 40

Abbreviations: C – compulsory, wh – week hours

Learning goals and qualifications

In-house seminars provide a platform for scientific conversation and for gaining insight in up-to-date research. The seminar and colloquium modules are a major component of the scientific education concerning both presentation and scientific discussion. The students improve their presentation skills by giving an own presentation and by discussing the presented topic with the audience. Moreover, they are trained in discussing topics at different scientific levels from presentations by their classmates, by the scientific staff, and by invited external speakers. In addition, the students get the chance to establish contacts to external researchers.

Syllabus

- a) The research seminar is a platform for presenting current in-house research topics. It is expected that students present results of their B.Sc. thesis. On a regular basis doctorate students report on their current state of their Ph.D projects. Members of the academic staff also contribute to the research seminar by presenting conference talks, etc. The research seminar is aimed at inspiring scientific debates between students and staff scientists. A further objective is to inform students about the research topics that are addressed in the institute.
- b) Presentations on up-to-date research topics, presented by invited and often internationally renowned speakers. The scientific spectrum comprises research topics of the institute (e.g. impact, planetology, structural geology, earth history, mineral, ore and oil deposits, geohazards, geothermal energy, environmental mineralogy, hydrology, geochemistry, crystal growth) and other branches of geosciences. To enhance the

practical aspect of the curriculum speakers from companies and industries are specifically welcome.

Teaching form

- a) Seminar with discussion
 - b) Seminar with discussion

3.1.3 Field Trips					
Module Coordinator Dr. H. Ulmer		Lecturers			
Type C	Workload 150 h	Credits 5 ECTS	Term WS/SS	Cycle -	Duration 4 terms
Course Field Trips and Visits to Industrial Facilities		Presence 10 days /90 h	Private study 60 h		Participants variable

Abbreviations: C – compulsory, wh – week hours

Learning goals and qualifications

In this module the core expertise of geoscientists – field work – is trained more extensively than it was possible in the B.Sc. program. Excursions are aimed at testing, applying and accompanying the theoretical knowledge acquired in the lectures and are ideal opportunities for exchange between students and lecturer. Upon participation at field trips the students refine their power of observation. Students learn to write concise reports. They enhance higher-order cognitive skills and inquiry skills, and understand geological processes in time and space. Students improve in geo-literacy and in knowledge of the regional geology. Visiting at industrial facilities students gain hands-on experience in manufacturing processes, application of geosciences in energy and materials' development and production, working life, and career prospects.

Syllabus

Field trips to rock outcrops play a fundamental role in understanding geological concepts. They are an essential part of the geological learning process in complementing classroom and lab teaching of science concepts. They also provide visual images that are needed to work with more abstract contents of modeling, remote sensing etc. Field trips involve elements of both instructor-led explanation and student centered exploration / discovery. Reviewing the trip afterwards is an important activity for cementing observations and interpretations into a comprehensive sense of conceptual understanding. Field trips range from day trips to field campaigns or residential courses of up to 2 weeks. Thematically they cover a wide variety of topics from understanding the regional geology of an area to studying specific geological phenomena like sedimentation, volcanism, metamorphism or environmental aspects. "Classical" geological areas are visited like the Alps, Iceland, Aeolian Islands, Eifel, Bohemian Massif, to name a few. Visits at industrial facilities play an important role linking scientific research and application centered industrial development in

geosciences and material sciences. A wide variety of companies and research institutes is visited, ranging from energy generation to waste handling and from raw material production to high-tech material design.

Teaching form

Field trip/visit at industrial facility, practical training in the field including data acquisition: (GPS, fabric, sampling strategies, drilling, etc.)

Examination form

3.1.4 Geographic Information Systems

Module Coordinator Dr. G. Wulf		Lecturer Dr. G. Wulf			
Type C	Workload 150 h	Credits 5 ECTS	Term SS	Cycle annual	Duration 1 term
Course Geographic Information Systems		Presence 4 wh / 60 h	Private study 90 h		Participants 20

Abbreviations: C – compulsory, wh – week hours

Learning goals and qualifications

Geographic Information System (GIS) technology has broad applications in natural and social sciences and has become an essential part of geosciences. This module introduces the theory and practice of GIS showing the spectrum of potential GIS applications. The students should gain both a theoretical and practical understanding of spatial data and GIS applications, including the key concepts and skills required to manage, handle, manipulate, analyze and display spatial data.

Syllabus

The course combines lecture-based teaching with linked practical exercises. It introduces the students to basic principles of GIS as well as key concepts of data acquisition and storage, data visualization and processing. The focus of the course lies on extensive practice in data handling and the usage of GIS applications for geoscientific issues. In the process, the students carry out practice-oriented case studies using a suitable GIS software package. The module assumes no prior knowledge or experience of GIS.

Teaching form

Lecture and practical work

Examination form

Achievement of learning goals (unmarked):

Examination: Homework (GIS-based mapping and data analysis) to be solved during the semester (60%) and a written project report at the end of the semester (40%).

3.1.5 Geological Project					
Module Coordinator Prof. Dr. F. Preusser		Lecturers			
Type C	Workload 150 h	Credits 5 ECTS	Term WS/SS	Cycle each semester	Duration 1 term
Course Geological Project		Presence ---	Private study 150 h		Participants ---

Abbreviations: C – compulsory, wh – week hours

Learning goals and qualifications

Individual geological projects are aimed at bridging the gap between teaching and research. Students directly get involved in research specific methods. They develop skills in design and execution of an independent research project, and in project management. Report writing and time management are trained.

Syllabus

The topics offered introduce theoretical and methodological approaches to the investigation and interpretation of geological, or geophysical, or sedimentological or mineralogical-petrological, or geochemical research by practical and/or laboratory-based programs. They commonly involve the hands-on use of available equipment to conduct a practical field or laboratory-based investigation of one of the topics named above, allowing you to test the theories/practices encountered during lectures.

These studies are undertaken under the supervision of members of the Freiburg geosciences staff.

Teaching form

Project-specific; initial project outline and monitoring of progress through regular meetings with the supervisor who also offers suitable advice on library search and review of appropriate literature, data analysis, interpretation and presentation; otherwise mainly free time management.

Examination form

Achievement of learning goals (unmarked): discussions with the supervisor (informal)

Type C	Workload 900 h	Credits 30 ECTS	Term --	Cycle --	Duration 6 months
Course ---		Presence ---	Private study 900 h		Participants ---

Abbreviations: C – compulsory

Learning goals and qualifications

The Master thesis asserts that the student is able to perform a scientific study in depth based on the competences acquired during the M.Sc. program.

Syllabus

In the Master thesis, a scientific topic related to the selected Elective Track is considered in depth. The student is guided thematically, methodically, and concerning the written thesis by two supervisors. The supervisors will also act as referees of the submitted thesis. At least one of the two referees must be full-time lecturer at the Faculty of Environment and Natural Resources.

3.2 Compulsory Modules of the Elective Tracks

3.2.1 Compulsory Modules *Mineralogy and Geochemistry*

3.2.1.1 Analytical Methods I					
Module Coordinator		Lecturer			
Dr. H. Müller-Sigmund		Dr. H. Müller-Sigmund			
Type	Workload	Credits	Term	Cycle	Duration
C Mineralogy and Geochemistry	150 h	5 ECTS	WS	annual	1 term
Course		Presence	Private study		Participants
Analytical Methods I		4 wh / 60 h	90 h		16

Abbreviations: C – compulsory, wh – week hours

Learning goals and qualifications

Students are introduced into the theoretical background of major analytical methods and machinery in modern mineralogy, geochemistry, and crystallography. They learn to decide upon the appropriate method and analytical settings for a given analytical problem. They perform all steps from sample preparation to analysis at the machine, evaluate result quality and are able to plot and interpret these results in their relevant context. Students are thus introduced to a spectrum of standard instrumental techniques, which are widespread in research as well as in industry.

Syllabus

In this course the theory, application, and operation of modern instrumental methods (SEM, EMPA, XRD, XRF, AAS) for chemical and physical analyses in environmental, Earth and materials science is introduced. Analytical advantages and limits are discussed. To the extent feasible, students get hands-on experience with the machinery in the course of lab exercises, concentrating on concrete small analytical projects, and learn how to present, evaluate, and interpret their data.

Teaching form

Lecture + Practice, multimedia introduction into the basics of the methods, hands-on experience with different machinery in small groups (3-4 students), oral presentation of data and critical data discussion within groups.

Examination form

Achievement of learning goals (unmarked): presence in the practical part, homework

Examination: written reports (80 %) and a short written test (20 %, 30 minutes)

3.2.1.2 Low-Temperature Geochemistry

Module Coordinator Prof. Dr. W. Siebel		Lecturer Prof. Dr. W. Siebel			
Type C Mineralogy and Geochemistry	Workload 150 h	Credits 5 ECTS	Term SS	Cycle annual	Duration 1 term
Course a) Marine Geochemistry b) Isotope Geochemistry		Presence a) 2 wh / 30 h b) 2 wh / 30 h	Private study a) 45 h b) 45 h		Participants a) 20 b) 20

Abbreviations: C – compulsory, wh – week hours

Learning goals and qualifications

The module covers the key aspects of marine geochemistry and methods in environmental and low-temperature isotope geochemistry and provides the student with an introduction to fundamental concepts of oceanography and isotope geology. The individual qualifications and skills of the module are specified below:

- a) In the course “Marine Geochemistry”, students will develop skills for understanding the basic principles and theories associated with the geochemical processes occurring in the oceans. The student will be familiar with sources and sinks of chemical elements or compounds, their distributions and their variability in the oceanic system and gather an understanding of how marine and coastal environments are impacted by natural climate variability or human activities.
- b) In the course “Isotope Geochemistry”, students learn about the principles of low-temperature radiogenic and stable isotope methods. They examine a variety of isotope systems and dating techniques, and become familiar with possible sources of error. Several lectures include classroom exercises on the same topic. At the end of the course the students will be familiar with the fundamentals of isotope geochemistry and know which isotopic system is suitable to solve a certain geological problem. She/he will also be able to interpret isotope data and understand Earth processes through isotope geochemistry.

Syllabus

Course a) introduces the concepts, the methods and the applications of marine geochemistry. Teaching topics include basic oceanographic principles operating in the marine realm, ocean basin bathymetry, the chemical properties of seawater, trace elements

and isotopes and their distribution in the water column, the marine carbon cycle, ocean water circulation, hydrothermal processes and life on the sea floor, as well as formation and distribution of marine sediments. Marine mineral resources and environmental issues will also be covered.

The focus of course b) is on radiogenic and stable isotope systems and their principles and applications in low-temperature environments. Topics and systems include:

- K-Ar and Ar-Ar methods and the meaning of cooling ages
- Fundamentals of stable isotope geochemistry, including definitions, terminology, basic principles and standards
- U-series disequilibrium dating
- Sr and Nd isotopic variations of sea water
- Principles of fission-track-dating
- Cosmogenic isotope analysis and geomorphology

Teaching form

- a) Lecture
- b) Lecture and exercises

3.2.1.3 Ore-Forming Processes

Module Coordinator Prof. Dr. D. Dolejš		Lecturers Prof. Dr. D. Dolejš, Dr. H. Geiger			
Type C Mineralogy and Geochemistry	Workload 150 h	Credits 5 ECTS	Term SS	Cycle annual	Duration 1 term
Course Ore-Forming Processes		Presence 4 wh / 60 h	Private study 90 h		Participants 15

Abbreviations: C – compulsory, wh – week hours

Learning goals and qualifications

This course is devoted to processes of metal distribution, transport and enrichment in Earth's lithosphere. We use process-oriented approach from mantle-derived mafic magmas and their metal budget through silicic magmas, their volatiles, exsolution and fractionation of metals towards a large group of hydrothermal and fluid-rock interaction processes. The course concludes with near-surface processes such as and fluid flow in sedimentary basins and ore-forming processes near Earth's surface (weathering and supergene mobilization).

Syllabus

- Introduction to ore systems and deposits
- Metals and sulfur in ultramafic and mafic systems
- Sulfide and oxide ore assemblages
- Magmatic fluid phase
- Mineral equilibria in hydrothermal fluids
- Hydrothermal transport of metals
- Computational models of reactive fluid flow
- Alteration geochemistry
- Fluid flow in the Earth's crust
- Metamorphic and sedimentary ore-forming fluids
- Supergene and surface processes
- Metamorphism of ore deposits

3.2.2 Compulsory Modules *Geomechanics and Tectonics*

3.2.2.1 Computing in Geosciences					
Module Coordinator Prof. Dr. S. Hergarten		Lecturers Prof. Dr. S. Hergarten			
Type C Geomechanics and Tectonics C Geohazards E Applied Quaternary Geology	Workload 150 h	Credits 5 ECTS	Term WS	Cycle annual	Duration 1 term
Course Computing in Geosciences		Presence 4 wh / 60 h	Private study 90 h		Participants 16

Abbreviations: C – compulsory, wh – week hours

Learning goals and qualifications

Numerical data analysis, visualization, and process modeling have become essential parts of quantitative geosciences. The successful students are able to describe simple processes in terms of differential equations and are able to implement fundamental schemes (finite difference methods) for the numerical solution in a high-level programming language (MATLAB). Beyond this, the students shall be able to assess which method is suitable for a given problem and be aware of potential pitfalls.

Syllabus

The class starts with an introduction to process modeling using simple population models based on ordinary differential equations and their implementation using explicit and implicit Euler schemes. The following main part of the module comprises the basic equations behind the models widely used for modeling mass and heat transport processes, solid mechanics, groundwater flow, and landform evolution based on partial differential equations. After discussing the respective equations, the underlying principles, and their mathematical properties, the simplest numerical techniques in the field of partial differential equations (finite differences, upstream schemes) are discussed. Theory is accompanied by a step-by-

step introduction to the MATLAB programming environment and exercises focusing on implementing the models in MATLAB and analyzing the results.

Teaching form

Lecture combined with practical exercises and homework.

Examination form

Achievement of learning goals (unmarked): ---

Examination: marked homework to be solved during the semester (software development and mathematical considerations, 85%) and online exercises to be solved in the class (15%).

Prerequisites for attending

3.2.2.2 Tectonics					
Module Coordinator Prof. Dr. T. Kenkmann		Lecturers Prof. Dr. T. Kenkmann Dr. M. Poelchau			
Type C Geomechanics and Tectonics	Workload 150 h	Credits 5 ECTS	Term SS	Cycle annual	Duration 1 term
Course Tectonics		Presence 4 wh / 60 h	Private study 90 h		Participants 20

Abbreviations: C – compulsory, wh – week hours

Learning goals and qualifications

This module deals with various plate tectonic scenarios. The students allocate structural characteristics and physical boundary conditions to these plate tectonic settings. The module provides a basic understanding of the geodynamics of the tectonic environments, e.g. the state of stress in the lithosphere. The presentation of case studies by the students familiarize them with various tectonic and geophysical techniques of crust-scale analyses.

Syllabus

A variety of plate tectonic scenarios is reviewed and their physical boundary conditions and associated geological phenomena are addressed. Case studies for each of the chapters are presented by the participants. The course also considers tectonic structures on other planets and satellites. The agenda of the module is:

Divergent motion:

- Continental graben tectonics
- Passive continental margins and basin formation
- Basin & Range tectonics

Transcurrent motion:

- Continental transform faults
- Inversion tectonics

Convergent motion:

- Accretionary wedges
- Andean style orogeny

-
- Cordillera style orogeny
 - Alpine style orogeny
 - Wrinkle ridges and lobate scarps

Radial Motion:

- Volcano and plume tectonics

Salt diapirism

Teaching form

3.2.2.3 Near-Surface Geophysics

Module Coordinator Dr. J. Wilk		Lecturer Dr. J. Wilk			
Type C Geomechanics and Tectonics	Workload 150 h	Credits 5 ECTS	Term SS	Cycle annual	Duration 1 term
Course Near-Surface Geophysics		Presence 4 wh / 60 h	Private study 90 h		Participants 16

Abbreviations: C – compulsory, wh – week hours

Learning goals and qualifications

Geophysical methods of subsurface exploration have received a growing interest in many fields of geosciences during the previous decades. The module focuses on the most important geophysical methods used in hydrogeology, environmental geology and engineering geology suitable for the exploration of the shallow subsurface. The module provides a basic understanding of these methods and expands on their application. The students learn which of the techniques is most appropriate under given conditions, to analyze the respective field data, and how to use the available instruments for the investigation of shallow geological structures.

Syllabus

The module focuses on the methods most relevant for the exploration of the shallow subsurface:

- seismics
- resistivity methods
- ground-penetrating radar
- geomagnetics

Both the theory behind the methods and the respective techniques of data analysis are considered. Understanding is deepened by exercises in the class, homework, and experiments in field.

Teaching form

Lecture accompanied by homework and field experiments.

Examination form

Achievement of learning goals (unmarked): regular attendance in the field measurements

Examination: Homework (calculations and computer-based data analysis) to be solved during the semester including reports of the field work

Prerequisites for attending

The module “Computing in Geosciences” must have been completed.

Usage of the module in other programs

3.2.3 Compulsory Modules *Geohazards*

3.2.3.1 Computing in Geosciences – see 3.2.2.1

3.2.3.2 Earthquakes and Tsunamis					
Module Coordinator Prof. Dr. S. Hergarten		Lecturers Prof. Dr. S. Hergarten			
Type C Geohazards	Workload 150 h	Credits 5 ECTS	Term WS	Cycle annual	Duration 1 term
Course Earthquakes and Tsunamis		Presence 4 wh / 60 h	Private study 90 h		Participants 16

Abbreviations: C – compulsory, wh – week hours

Learning goals and qualifications

Earthquakes and tsunamis are among the most important natural hazards on Earth and thus a major fields of professional activity in the context of geohazards. As a main qualification, the successful students are able bring the rather extensive and complicated theory of seismology and tsunami propagation into the context of geohazards and include their theoretical knowledge in hazard assessment. Beyond this, they are able to understand und interpret scientific results on historical and recent events as well as hazard assessment provided in the literature in a realistic way.

Syllabus

The first part of the module focusing on seismology and seismic hazard combines the classical theory of wave propagation with geological and statistical aspects comprising the following topics:

- Types of elastic waves and theory of wave propagation
- Focal mechanisms; seismic moment tensor
- Localization of earthquakes
- Earthquake intensity and magnitude; different definitions of magnitude and their relevance

In the second part, the theoretical concepts of wave propagation and the concepts of intensity and magnitude are transferred to the propagation of tsunami waves.

Teaching form

Lecture with discussion and additional exercises.

Examination form

Achievement of learning goals (unmarked): ---

Examination: Homework (analytical and computer-based calculations) to be solved during the semester.

Prerequisites for attending

The module “Computing in Geosciences” must have been completed.

3.2.3.3 Hazard, Risk, and Prediction

Module Coordinator Prof. Dr. S. Hergarten		Lecturers Prof. Dr. S. Hergarten			
Type C Geohazards	Workload 150 h	Credits 5 ECTS	Term WS	Cycle annual	Duration 1 term
Course Hazard, Risk, and Prediction		Presence 4 wh / 60 h	Private study 90 h		Participants 16

Abbreviations: C – compulsory, wh – week hours

Learning goals and qualifications

Assessing hazard and risk is one of the major fields of professional work in the context of geohazards. This module provides a synthesis of the specific modules of the Elective Track Geohazards. The successful students are able to apply theoretical concepts from statistics to hazard assessment, to derive hazard maps and can distinguish between the terms hazard and risk. Beyond this, the students achieve basic knowledge about concepts of prediction and about contemporary theoretical concepts unifying different types of geohazards and improve their abilities in analyzing data quantitatively.

Syllabus

The main topics of the module are:

- Hazard and risk
- Event-size distributions and frequency-magnitude relations; general concepts and distributions for different geohazards
- Recurrence times
- Temporal correlations
- Assessment of predictions
- Self-organized criticality

Teaching form

Lecture combined with discussion, practical exercises and homework.

Examination form

Achievement of learning goals (unmarked): ---

Examination: homework (analytical and computer-based calculations and interpretation of data) to be solved during the semester.

Prerequisites for attending

The module “Computing in Geosciences” must have been completed. Beyond this, it is helpful to have attended as many of the other modules of the elective track *Geohazards*.

3.2.4 Compulsory Modules *Applied Quaternary Geology*

3.2.4.1 Engineering Geology and Geotechnics					
Module Coordinator Prof. Dr. F. Preusser		Lecturers a) Prof. Dr. F. Preusser b) Prof. Dr. F. Preusser			
Type C Applied Quaternary Geology E Geomechanics and Tectonics E Geohazards	Workload 150 h	Credits 5 ECTS	Term SS	Cycle annual	Duration 1 term
Course a) Introduction to Engineering Geology b) Geotechnical Projects		Presence a) 2 wh / 30 h b) 2 wh /30 h	Private study a) 45 h b) 45 h		Participants a) 16 b) 16

Abbreviations: C – compulsory, wh – week hours

Learning goals and qualifications

Many students will find work in the field of engineering and environmental geology. This course aims at providing the necessary basic background in this field. Attendees will be familiar with the basic concepts, nomenclature and problems of applied geology and hence should be able to communicate about and approach applied aspects in geosciences.

Syllabus

- a) The course will introduce basic concepts, nomenclature and problems of applied geology with a focus on physical properties of unconsolidated sediments (soils). This will be combined with some practical work on basic methods and approaches.
- b) Students will put together an oral presentation on a selected geotechnical project and will present and discuss this in class.

Teaching form

-
- a) Lecture mixed with practical exercises
 - b) Seminar
-

Examination form

Achievement of learning goals (unmarked): a) Active participation in the exercises; b) Attendance of the seminar

Examination: Written examination about (a) (60 %, 90 minutes), lab report about (a) (10 %) and oral presentation in (b) (30 %)

Prerequisites for attending

Abbreviations: C – compulsory, wh – week hours

Learning goals and qualifications

Students who successfully complete this module will have developed an understanding of modern sedimentology. The module is subdivided into two courses, one focusing on the theoretical background and the other on practical issues of describing sediments.

Syllabus

- a) This course concentrates on the sedimentary dynamics and archives found such as in glacial, fluvial, aeolian, and coastal settings. After this course students will understand these sedimentary systems in detail, will be able to describe and interpret sedimentary sequences, and put these observations into a local, regional and global context.
- b) Students will learn how to describe (log) sediments in outcrops and cores.

Teaching form

- a) Lecture
- b) Practical work

Examination form

Achievement of learning goals (unmarked): Regular attendance in the practical part (b)

Examination: Written tests during the term (a) (60 %) and project report (b) (40 %)

Prerequisites for attending

Course Earth Management		Presence 2 wh / 60 h	Private study 90 h		Participants 16

Abbreviations: C – compulsory, wh – week hours

Learning goals and qualifications

Students who successfully complete this module will have developed an understanding of how the Earth surface is modified and what kind of hazards are introduced by humans. This will include the presentation of the legal framework, regulations, procedures as well as economic aspects related to the wider field of geosciences.

Syllabus

This course introduces the following topical fields:

- Methods of protection against geohazards (floods, mass movements)
- Soil erosion, causes and countermeasures
- Concepts of landscape sculpturing such river regulation
- Hazardous substances (natural and artificial chemicals, dust, hydrate)
- Geo-engineering

Teaching form

3.3 Elective Modules Assigned to the Elective Tracks

3.3.1 Elective Modules *Mineralogy and Geochemistry*

3.3.1.1 Igneous Processes					
Module Coordinator		Lecturers			
Prof. Dr. D. Dolejš		Prof. Dr. D. Dolejš			
Type	Workload	Credits	Term	Cycle	Duration
E Mineralogy and Geochemistry	150 h	5 ECTS	WS	biannually WS 2021/22 WS 2022/23	1 term
Course		Presence	Private study		Participants
Igneous Processes		4 wh / 60 h	90 h		25

Abbreviations: E – elective, wh – week hours

Learning goals and qualifications

The principal objectives of this course are understanding of atomistic structure of silicate melts, physical properties of silicate magmas, use of phase diagrams, crystallization kinetics (nucleation, growth, crystal size distribution), magma rheology, internal dynamics of magma chambers, formation of crystal fabric, volatiles in silicate magmas, eruptive styles and pyroclastic deposits. The students obtain versatile knowledge of formation, evolution and behavior of magmas in the Earth's crust and mantle.

Syllabus

- Structure of silicate melts
- Physical properties of melts and magmas
- Melt generation in the Earth
- Magma differentiation: crystal-melt equilibria
- Phase equilibrium modeling of magmatic systems: MELTS software
- Geothermobarometry of igneous rocks
- Crystal nucleation and growth
- Crystallization, crystal size distribution and rheological thresholds
- Magma differentiation: mechanical dynamics
- Volatiles in silicate magmas, fluid exsolution and degassing
- Dynamics of volcanic eruptions

Teaching form

3.3.1.2 Metamorphic Processes

Module Coordinator Prof. Dr. D. Dolejš		Lecturers Prof. Dr. D. Dolejš			
Type E Mineralogy and Geochemistry	Workload 150 h	Credits 5 ECTS	Term WS	Cycle biannually WS 2020/21 WS 2022/23	Duration 1 term
Course Metamorphic Processes		Presence 4 wh / 60 h	Private study 90 h		Participants 25

Abbreviations: E – elective, wh – week hours

Learning goals and qualifications

The students acquire ability to interpret metamorphic processes and conditions using mineral-fluid equilibria and kinetics. The learning goals include temperature ranges of regional and contact metamorphic conditions, and perform chemographic analysis of mineral assemblages. They learn principles of mineral thermodynamics, inverse modeling and geothermobarometry including working knowledge of software packages Thermocalc, Theriak and Perplex. Attention will be paid to deformation mechanisms in natural rocks and interpretation of deformation and recrystallization textures in the polarization microscope. Students will be able to interpret metamorphic conditions associated with diverse tectonic settings in the lithosphere.

Syllabus

- Metamorphism: equilibrium and kinetic concepts
- Crystal chemistry of rock-forming minerals
- Composition space and thermodynamics of minerals
- Construction of metamorphic phase diagrams: Theriak software
- Local and partial equilibria
- Inverse equilibrium models: Thermocalc software
- Metamorphic crystallization and local mass transport
- Chemical potentials and reaction affinity as driving forces for phase transformations
- Deformation laws and paleopiezometry
- Rheology of polymineralic and partially molten rocks
- Metamorphic fluids, internal and external buffering

3.3.1.3 High-Temperature Geochemistry

Module Coordinator Prof. Dr. W. Siebel		Lecturers Prof. Dr. W. Siebel			
Type E Mineralogy and Geochemistry	Workload 150 h	Credits 5 ECTS	Term WS	Cycle annual	Duration 1 term
Course a) Geochemical evolution of the Earth's mantle and crust b) High-Temperature Geochronology		Presence a) 2 wh / 30 h b) 2 wh / 30 h	Private study a) 45 h b) 45 h		Participants a) 20 b) 20

Abbreviations: E – elective, wh – week hours

Learning goals and qualifications

The module contains two courses. Course a) gives insight into the composition and evolution of the Earth's mantle and crust. Course b) covers the key aspects of high-temperature radiometric dating and tracing methods. The individual qualifications and skills of the module are specified as follows:

- a) The silicate Earth encompasses the crust and mantle. On successful completion of course a), students should be able to know how these two major reservoirs were created and modified over geological time and about the magmatic processes that lead to their present composition. Basaltic rocks from mid-ocean ridges and intraplate volcanoes place constraints on the composition of the underlying mantle the presence of small- or large-scale heterogeneities. Subduction zone volcanism causes the large earthquakes and volcanic hazard but it also helps to understand the processes, which lead to the formation and composition of the continental crust.
- b) In this course, students learn about the principles of high-temperature radiogenic isotope methods. They realize that isotopes are indispensable tools for reconstructing various Earth processes, palaeo-environmental conditions and for radiometric dating. Several lectures include classroom exercises on the same topic. At the end of the course the students will be familiar with the fundamentals of isotope geochemistry and know which isotopic system is suitable to solve a certain geological problem. She/he will also be able to interpret isotope data and understand Earth processes through isotope geochemistry.

Syllabus

Course (a) provides essential insight into magmatic processes associated with plate boundary environments (mid-ocean ridges and subduction zones) and within plate regions (ocean islands and volcanic plateaus). The geochemical and isotopic composition of the different mantle reservoirs will be discussed and magmatic and tectonic processes along subduction zones will be explored. The lecture also focusses on fundamental processes that gave rise to the characteristic geochemical features of the continental crust and the different mantle reservoirs. These topics provide the basis for homework questions and student reports.

The focus of courses b) is on radiogenic isotope systems and their principles and applications in high-temperature geology. Topics and systems include:

- Principles of the Rb-Sr, U-Th-Pb, Sm-Nd and Lu-Hf dating and tracing methods
- Isotopes as tracers of sources and processes; presentation of case studies
- Radionuclides and their measurement techniques

Teaching form

- a) Lecture
- b) Lecture and exercises

Examination form

Achievement of learning goals (unmarked): exercises

Examination: written test (120 minutes)

Prerequisites for attending

Basic knowledge in geochemistry at the level to B.Sc. course "Geochemistry"

3.3.1.4 Analytical Methods II

Module Coordinator Dr. H. Müller-Sigmund		Lecturers a) Dr. H. Müller-Sigmund; Dr. K. Schlöglöva b) Prof. Dr. M. Fiederle			
Type E Mineralogy and Geochemistry	Workload 150 h	Credits 5 ECTS	Term SS	Cycle annual	Duration 1 term
Course a) Advanced Analytical Methods b) High-Resolution Spectroscopy		Presence a) 3 wh / 45 h b) 2 wh / 30 h	Private study a) 15 h b) 60 h		Participants a) 9 b) 15

Abbreviations: E – elective, wh – week hours

Learning goals and qualifications

Advanced analytical methods are essential for the investigation of solid state materials and the understanding of the correlation between material properties and technology. The analytical methods are an important part of this curriculum. The students will be competent in choosing analytical techniques for the characterization of solid state materials. The students will be able to analyse and evaluate experimental data and identify different classes of solid state materials.

- a) Students learn to prepare rocks and minerals for specific analytical applications and apply these methods. They amplify their knowledge in several techniques and are able to deduce on the composition and formation conditions of these samples.
- b) This course covers spectroscopic and diffraction methods and the students will be able to differentiate the interaction between crystalline material with probe beams like X-rays, ionized particles, electrons and photons. They interpret the outcome of these interactions for mass spectroscopy, surface analysis, diffraction and tomography.

Syllabus

- a) The emphasis of this course is on important mineralogical techniques used in ore geology, petrology, geomaterials, soil science, and environmental science. Students explore various methods, e.g. cathodoluminescence, fluid inclusions on heating-freezing stage, reflected light microscopy, clay mineral preparation techniques etc. both in theory and in the laboratory, where hands-on experience is an essential part of the course.
-

-
- b) The course provides tools for the characterization of solid state materials: UV-VIS and IR spectroscopy, surface analysis methods using X-ray photon spectroscopy (XPS), secondary ion mass spectroscopy (SIMS), laser-induced breakdown spectroscopy (LIBS), and Auger spectroscopy (AGS). To analyze the local geometry, the chemical state and coordination spheres of atoms X-ray absorption spectroscopy (XAS), extended absorption fine structure (EXAFS), and X-ray absorption near-edge Structure (XANES) will be presented. To find the oxidation state of atoms (e.g., Fe^{2+} , Fe^{3+}), Mössbauer spectroscopy will be explained. Other high-resolution methods discussed are: Raman spectroscopy, STM and AFM microscopy, and TEM microscopy.
-

Teaching form

- a) Lecture + laboratory practical sessions (small groups of 2-3 students)
b) 3D multimedia introduction into the various methods, supported by solving problems and discussion of results in practical sessions.
-

Examination form

Achievement of learning goals (unmarked): a) presence in the practical part; b) analysis of experimental data and solution of exercise problems

Examination: Marked written reports on a) (40 %) and written test on b) (60 %).

Prerequisites for attending

The module *Analytical Methods I* must have been completed.

3.3.2 Elective Modules *Geomechanics and Tectonics*

3.3.2.1 Petrophysics					
Module Coordinator Prof. Dr. T. Kenkmann		Lecturers a) Prof. Dr. T. Kenkmann; Dr. M. Poelchau b) Dr. M. Poelchau			
Type E Geomechanics and Tectonics E Applied Quaternary Geology	Workload 150 h	Credits 5 ECTS	Term WS	Cycle biannual WS 2021/22 WS 2023/24	Duration 1 term
Course a) Petrophysics b) Rheology and Textures		Presence a) 2 wh / 30 h b) 2 wh / 30 h	Private study a) 45 h b) 45 h		Participants 40 40

Abbreviations: E – elective, wh – week hours

Learning goals and qualifications

- a) The successful student is getting acquainted with the petrophysical properties of the most important rock types. They quantitatively determine and measure porosities, mineral constituents, fabric of rocks etc. and correlate them with petrophysical data. Students are enabled to interpret petrophysical borehole data with respect to lithology, porosity, structure, and economic potential.
- b) Students will describe rock fabrics and mineral constituents of metamorphic and igneous rocks making use of polarizing microscopes. They will identify and describe shape-preferred orientations as well as crystallographic preferred orientations. They will recall and apply techniques to measure rock textures and interpret pole figures and orientation distribution functions. Based on rock textures and fabric analysis the successful students are able to decipher deformation mechanisms and associated flow laws of natural rocks and estimate the conditions during deformation (pressure, temperature, strain, strain rate).

Syllabus

- a) Petrophysics is the study of the physical properties of rocks. Its objective is to explain why rocks have the properties they do. In particular how the relative amounts and arrangements of the minerals that comprise them determine their physical properties. Petrophysics is key

in numerous applications of geosciences and various fields of rock engineering and well logging. The course program comprises the following sections: (i) Rock classifications, (ii) Density, (iii) Porosity & Permeability, (iv) Radioactive Properties, (v) Geomechanical Properties (vi) Electrical properties, (vii) Magnetic properties, (viii) Well-logging.

- b) Rheology is the study of the flow of matter. In Earth Sciences the focus of rheology is on the ductile flow of mid- and lower crustal rocks in response to applied forces at elevated temperatures. This course is designed to introduce the theory of plasticity and presents various flow laws (Newtonian, power law, etc.) of rocks and how these were determined. The flow behavior is compared with deformation mechanisms operating in the ductile field (diffusion creep, dislocation creep, dislocation glide, etc.). A major goal of the course is to gain practice in interpreting deformation features observed in rock thin sections under the polarizing microscope. A crucial role in deciphering deformation mechanisms is the analysis of shape- and crystallographic preferred orientations of deformed polycrystalline aggregates. Techniques are presented how rock textures can be measured and interpreted.

Teaching form

- a) Lecture + Exercises/Homework
b) Lecture and practical work at the polarizing microscope

Examination form

Achievement of learning goals (unmarked): Regular attendance in the practical parts of (a) and (b), completion of exercises (a)

Examination: written test (60 %, 90 minutes), and presentation the project work in oral and written form (b) (40%).

Prerequisites for attending

Experience in polarized light microscopy is beneficial.

3.3.2.2 Rock Mechanics

Module Coordinator Dr. M. Poelchau		Lecturers a) Prof. Dr. T. Kenkmann; Dr. M. Poelchau b) Dr. M. Poelchau; Prof. Dr. T. Kenkmann			
Type E Geomechanics and Tectonics E Applied Quaternary Geology	Workload 150 h	Credits 5 ECTS	Term WS	Cycle biannual WS 2020/21 WS 2022/23	Duration 1 term
Course a) Stress and Strain b) Brittle Rock Deformation		Presence a) 2 wh / 30 h b) 2 wh / 30 h	Private study a) 45 h b) 45 h		Participants a) 25 b) 25

Abbreviations: E – elective, wh – week hours

Learning goals and qualifications

- The successful student is getting acquainted with matrix calculations to calculate principal stress and strain states in rocks and to determine orientation of the principal axis of stress and strain. Students use graphical techniques to determine normal and shear stresses. Students become familiar with various methods of paleo-stress measurement and the measurement of recent stress fields in the crust. The quantification of strain accumulated in rocks is trained as well. Students get familiar with connecting stress and strain in linear isotropic elastic materials.
- Students become familiar with the concepts of rock deformation and know how to derive rock mechanical characteristics such as the tensile strength, uniaxial compressive strength, Mohr-Coulomb strength, dynamic and static friction, Poisson ratio, Young Modulus, Tangent Modulus, and the dynamic increase factor.

Syllabus

- Forces which are responsible for the deformations of the earth's crust act instantaneously and cannot be stored in rocks through time. Deformations of rocks are persistent and all the studied deformations are old, but the related stresses are not visible any more. Furthermore it is impossible to measure stress directly and only very special fabrics allow to describe state and direction of stresses. Nevertheless, one of the major goals of the lecture is to understand the distribution of forces in the earth and how

those forces act to produce the different structures. There are lots of practical reasons to do this: earthquakes, oil well blowouts, motor of plate tectonics, landslides etc. The deals with stress acting on a plane and stress at a point leading to the concept of principle and deviatoric stresses, which mathematically are described by stress tensor and 3x3 stress matrix. Different states of stresses and stress fields are introduced and presented methods of measurements include fault-slip analysis, stylolites, wellbore break-out, etc. The strain concept is mathematically based on continuous deformation thus strain is a branch continuum mechanics. In nature deformation is much more complex and far beyond being continuous. In this lecture all different aspects of a deforming rock system are introduced i.e. homogeneous vs. heterogeneous strain, progressive strain, infinitesimal vs. finite strain. We introduce to various quantitative strain measurement techniques including Fry and Rf-phi.

- b) Brittle rock deformation is concerned with evaluating, through controlled laboratory experiments, the effects of environmental and material factors on the deformational behavior of rocks. The course deals with rock elasticity, friction, various modes of brittle failure, brittle-to-ductile transition, plastic deformation, and dynamic deformation. The course consists of a theoretical part and a practical part.

Teaching form

- a) Lecture + exercises
b) Lecture, exercises and laboratory work

Examination form

Achievement of learning goals (unmarked): a) Homework; b) Report of the experimental analyses

Examination: Written examination (a+b, 90 %) and lab report about b) (10 %)

Prerequisites for attending

The module *Computing in Geosciences* should be either completed or attended in the same semester.

Usage of the module in other programs

3.3.2.3 Planetary Dynamics

Module Coordinator Prof. Dr. T. Kenkmann		Lecturers Prof. Dr. T. Kenkmann; Dr. M. Poelchau			
Type E Geomechanics and Tectonics	Workload 150 h	Credits 5 ECTS	Term WS	Cycle biannual WS 2020/21 WS 2022/23	Duration 1 term
Course Planetary Dynamics		Presence 3 wh / 45 h	Private study 105 h		Participants 25

Abbreviations: E – elective, wh – week hours

Learning goals and qualifications

Why is the Solar System the way it is? Students attending the course successfully know why. The students describe the planetary bodies by means of their physical, chemical, and astronomical boundary conditions. They can interpret surface features and conclude on dynamic interior and exterior geological processes that are dominant on and within these bodies. The students apply remote sensing techniques in combination with geo-information systems (GIS) to unravel the history of planets. Students understand that the evolution of the Earth and life to its present state is a consequence of a specific set of planetary boundary conditions. Students recapitulate the strategies, boundary conditions, requirements and major findings of various space missions.

Syllabus

Understanding Earth requires a planetological perspective. The course starts with a grand tour through our solar system. The formation (accretion, differentiation) of the solar system and the planetological boundary conditions and physical properties of planetary bodies are given. Our knowledge on the solar system is closely linked with the technological development of space craft and exploration techniques. The practical course deals with remote sensing methods and imagery. Students shall interpret planetary surfaces by means of active geological processes. Volcanic eruptions and tectonic activities of terrestrial planets are linked with the interior structure of these bodies. Planetary surface processes (fluvial, aeolian, impact) and atmospheres are further topics that are compared between different planetary bodies. Minor bodies in the Solar system of the asteroid belt, the Kuiper belt and the Oort cloud are investigated as well. The giant planets of the outer solar system and their satellites complete the introduction to the solar system.

Teaching form

Lecture with audio-visual demonstrations, numerical simulations and high speed videos of experiments. Practical part partly at the polarizing microscope. Investigation of impactite rocks and meteorites. Exercises. Each participant presents a space mission in an oral and written contribution.

Examination form

Achievement of learning goals (unmarked): completion of exercises, oral presentation and report

Examination: Written examination (70 %), and exercises (30%, calculations)

Prerequisites for attending

The module *Computing in Geosciences* should be either completed or attended in the same semester.

Usage of the module in other programs

3.3.2.4 Impact Geology					
Module Coordinator Prof. Dr. T. Kenkmann		Lecturers Prof. Dr. T. Kenkmann; Dr. M. Poelchau			
Type E Geomechanics and Tectonics E Geohazards	Workload 150 h	Credits 5 ECTS	Term WS	Cycle biannual WS 2021/22 WS 2023/24	Duration 1 term
Course Impact Geology		Presence 4 wh / 60 h	Private study 90 h		Participants 40

Abbreviations: E – elective, wh – week hours

Learning goals and qualifications

Students will be able to estimate the statistical risk and threat of impact events and know the basics of Near Earth Asteroids and NEO-monitoring. The successful student can recapitulate the short-term geological and physical processes that occur during an impact. Students will deduce impact energies from crater morphologies and are able to determine the age of a planetary surface by measuring the size-frequency distribution of impact craters on it. They will be able to correctly describe impact lithologies, impact-induced microstructures, and impact structures. These skills will enable them to become competent in discovering new impact structures on Earth using remote sensing techniques, where they will be responsible for planning and conducting their own project (project “Screening Earth”). Here, they will improve their skills in scientific presentations and defend their ideas in scientific debates. They will learn to prepare the logistics for a scientific expedition.

Syllabus

The collision of solid bodies is one of the most fundamental geological processes in our solar system forming and reshaping planetary surfaces. The size-frequency distribution of impact craters on planetary surfaces and the current cratering rate and impact probability are presented including mitigation strategies. Composition and provenance of asteroids, comets and meteorites and their importance as possible impacting projectiles are highlighted. Special emphasis is drawn on Near Earth Asteroids and NEO monitoring. The physics of impact crater formation including contact- and compression, excavation, and modification provide the base for understanding geological phenomena in terrestrial and planetary craters. The principles of the progressive shock metamorphism as well as impact petrography are taught in practical exercises. The course gives introductions to the

morphology, structural geology, geophysical characteristics of impact craters, and their environmental effects on the hydrosphere and atmosphere. Modern techniques to investigate impact structures including remote sensing, computational simulation, and experimental methods are shown. Within the “Screening Earth” project, the participants undertake a crater search survey on earth utilizing Google Earth® imagery. Promising structures will be investigated in greater detail using geological maps, geophysical data, and further remote sensing resources. In an oral presentation the students introduce to their projects and assess the likelihood of the discovered structures being impact craters. Students will plan a scientific expedition to their discovered structures.

Teaching form

Lecture, exercises, project *Screening Earth* with presentation

Examination form

Achievement of learning goals (unmarked): Regular attendance in the project part, consideration of the project

Examination: Written test (70 %, 90 minutes), homework (calculations, 15 %), and oral presentation (15 %)

3.3.2.5 Shock Waves in Rocks

Module Coordinator Prof. Dr. Thomas Kenkmann		Lecturer Prof. Dr. Frank Schäfer			
Type E Geomechanics and Tectonics	Workload 150 h	Credits 5 ECTS	Term WS + SS	Cycle annual	Duration 2 terms a) one term b) one term or as a block course
Course a) Shock Waves in Rocks I b) Shock Waves in Rocks II		Presence a) 2 wh / 30 h b) 2 wh / 30 h	Private study a) 60 h b) 30 h		Participants a) 30 b) 30

Abbreviations: E – elective, wh – week hours

Learning goals and qualifications

Collisions of planetary bodies are among the most fundamental processes in solar system. During such impact processes, the materials of the involved bodies are subject to extreme dynamical loads that are always associated with the generation and propagation of shock waves. The students achieve a basic understanding of the fundamentals of shock wave physics, applications of shock waves, the mathematical description of shock waves in one dimension, and the thermodynamic processes relevant for meteorite impact. They are able to draw conclusions from the respective mathematical equations and develop simple implementation in computer codes

Syllabus

- a) The lecture starts with an introduction into shock waves, where they occur, and what they are applied for. A mathematical description of shock waves in one dimension is then given, starting from first principles. Also, the concept of equation of state for solids is introduced, and how to use them for shock wave computations. The lecture includes a number of exercises, also including computations with spreadsheets.
- b) The lecture starts with an introduction in to thermodynamic theory. Then, the principles of the shock- and release processes are taught, followed by computations of the thermodynamic heating of materials following a shockwave passage. The lecture includes a number of exercises, using spreadsheets.

Teaching form

- a) Alternating lectures and exercises
- b) Workshop: alternating lectures and exercises

Examination form

Achievement of learning goals (unmarked): ---

Examination: homework (analytical and computer-based calculations, 50 %) and written exam (50 %)

3.3.2.6 Remote Sensing					
Module Coordinator Dr. G. Wulf		Lecturer Dr. G. Wulf			
Type E Geomechanics and Tectonics	Workload 150 h	Credits 5 ECTS	Term WS	Cycle annual	Duration 1 term
Course Remote Sensing		Presence 4 wh / 60 h	Private study 90 h		Participants 20

Abbreviations: E – elective, wh – week hours

Learning goals and qualifications

The increasing quality, resolution and availability of remote sensing data, especially over the last years, permit unprecedented opportunities for geological and geomorphological analyses with a high measure of precision. The applications of remote sensing analyses show a strong multidisciplinary character and consequently, the use, handling and analysis of such data has become indispensable in modern geosciences. The students should gain both a theoretical and practical understanding of remote sensing data and the ability to work independently using appropriate software applications for geoscientific issues.

Syllabus

The course gives students a thorough understanding of digital remote sensing and analysis techniques and applications. The module explores basic principles of remote sensing and the use of suitable software packages for quantitative analysis, e.g. GIS. In addition, the students will be trained to perform qualitative analyses with special focus on visual image interpretation. The course combines lecture-based teaching with linked practical exercises and includes case studies from the focus areas of the M.Sc. Geology program.

Teaching form

Lecture and practical work

Examination form

Achievement of learning goals (unmarked): ---

Examination: Homework (computer-based data analysis) to be solved during the semester (60%) and a written project report at the end of the semester (40%).

Prerequisites for attending

The module *Geographic Information Systems* must have been completed.

3.3.3 Elective Modules *Geohazards*

3.3.3.1 Mass Movements					
Module Coordinator		Lecturer			
Prof. Dr. S. Hergarten		Prof. Dr. S. Hergarten			
Type	Workload	Credits	Term	Cycle	Duration
E Geomechanics and Tectonics E Geohazards	150 h	5 ECTS	SS	annual	1 term
Course		Presence	Private study		Participants
Mass Movements		3 wh / 45 h	105 h		16

Abbreviations: E – elective, wh – week hours

Learning goals and qualifications

Mass movements are the most important type of geohazards in mountainous regions. Assessing hazard and risk related to the various types of mass movements (shallow and deep-seated landslides, rockslides, rockfalls, rock avalanches, debris flows, and snow avalanches) is one of the biggest fields of professional activity in the context of geohazards. The module provides a basic understanding of the respective processes, their representation by differential equations and their implementation in numerical models. The students learn how to implement the simplest versions of the models in own computer codes (MATLAB), to assess which type of model is suitable for a given situation, and where the limitations in application to real-world scenarios are.

Syllabus

The class starts with an overview over the various processes of mass movements and their characteristic properties. Afterwards the basic models of slope stability are discussed (method of slices, Bishop's method). The main part of the module concerns the different types of rapid mass movements (sliding, falling, avalanching) and their quantitative description. Understanding is deepened by exercises covering the range from implementation of simple models to hazard assessment.

Teaching form

Lecture mixed with practical exercises and homework.

Examination form

Achievement of learning goals (unmarked): ---

Examination: Homework (computer-based calculations) to be solved during the semester

3.3.3.2 Volcanology and Volcanic Hazards

Module Coordinator Prof. Dr. F. Preusser		Lecturers Dr. V. May, Dr. L. Fischer			
Type E Geohazards E Applied Quaternary Geology	Workload 150 h	Credits 5 ECTS	Term WS	Cycle Biannual WS 2020/21 WS 2022/23	Duration 1 term
Course Volcanology and Volcanic Hazards		Presence 60 h	Private study 90 h		Participants 25

Abbreviations: E – elective, wh – week hours

Learning goals and qualifications

By undertaking this subject the students will learn; basic concepts in volcanology, magmatic chamber zonation, lava rheology and its relationship with gases and chemical composition, the different types of volcanic eruptions, deposits and structures, types of volcanic hazards, methods of monitoring volcanoes and the implications of small and large volcanic eruptions. Furthermore, the students will develop presentation and scientific writing skills.

Syllabus

This module is designed in a source to surface structure; from the essential processes occurring in the magmatic chamber to how magma erupts, the diversity of volcanic structures on the Earth's surface and the hazards volcanoes impose as well as possible ways of minimizing their hazard and risk. The subject is divided into two main blocks one concentrated on the physical aspects of volcanology and the second on volcanic hazards. During the first 6 lectures the students will learn, basic concepts in volcanology from melting to volcanic edifices and sediments, while the last 5 lectures of the semester will deal with direct and indirect volcanic hazards.

Teaching form

Online lectures (every week) and online workshops (every second week, to be advised)

Examination form

Achievement of learning goals (unmarked):

Examination: oral presentation (25 %), workshop participation and quizzes (40 %), final report (35%)

3.3.3.3 Climatic Geohazards					
Module Coordinator Prof. F. Preusser		Lecturers William McCreary III & several guest lecturers			
Type E Geohazards E Applied Quaternary Geology	Workload 150 h	Credits 5 ECTS	Term WS	Cycle biannual WS 2020/21 WS 2022/23	Duration 1 term
Course Climatic Geohazards		Presence 4 wh / 60 h	Private study 90 h		Participants 24

Abbreviations: E – elective, wh – week hours

Learning goals and qualifications

The students who successfully completed the module will have gained understanding of Earth's climate system and on natural hazards which can be linked to a changing climate, such as droughts, floods, wildfires, etc. The students will also learn about specific climatic geohazards in various regions worldwide. The participants will also improve their skills in critically evaluating scientific publications and debate press releases, synthesizing data, and presenting in front of an audience.

Syllabus

- a) This course is composed of 1) a series of lectures giving the participants background information into the topic, including the Earth system and its sensitivity to climate, as well as climate-related geohazards on both short or long-term perspectives; and 2) a synthesis and presentation of chosen climatic geohazards in specific regions, undertaken by the students.
- b) This part consists of a critical analysis of current research papers presenting case studies related to various climatic geohazards, in which the students will take an active part. It comprises choosing appropriate papers to discuss, participating in an open debate, and writing a short synthesis of the paper and associated discussion.

Teaching form

Lecture and seminar

Examination form

Achievement of learning goals (unmarked): Regular attendance of the seminar parts

Examination: Literature review and written report on geohazards (50 %), seminar presentation (25 %) and critical paper discussion reports (25 %).

Learning goals and qualifications

Students who successfully complete this module will have developed an understanding of how environmental conditions in the recent past are reconstructed and on how the Earth changed during the Quaternary. They will also know about the structure of Quaternary deposits in key regions of our planet.

Syllabus

This course concentrates on 1) an introduction to the main proxies used for environmental/climatic reconstruction, 2) an introduction to the dating methods most commonly used in Quaternary research, and 3) an overview of the history of main environmental and climatic changes that occurred during the Quaternary. After this course students will gain a comprehensive picture of Quaternary research and will be able to design projects related to the multi-proxy analysis of climate/environmental change in various contexts. They will themselves present the regional Quaternary geology of selected regions such as the Upper Rhine Graben, the northern Alpine Foreland or Northern Germany.

Teaching form

Abbreviations: E – elective, wh – week hours

Learning goals and qualifications

Water is an ubiquitous component and resource on the Planet Earth. Its diverse physical and chemical roles are best seen in its reservoir properties, flow dynamics, geothermal systems or ore formation by hydrothermal processes. In this module students acquire detailed knowledge of hydrochemical cycle of water and aqueous fluids in the lithosphere. They will understand hydraulic principles, which govern flow in permeable rocks and control available water supplies. They learn and interpret hydraulic and hydrochemical properties of diverse rock formations, ranging from sedimentary cover to crystalline basement, with examples from southwestern Germany and applications to geothermal energy systems. The students will be able to process geochemical data from natural waters, calculate and interpret their speciation and to derive and evaluate fundamental equilibrium and kinetic processes, which govern the composition of natural waters by weathering, dissolution and precipitation reactions.

Syllabus

- a) This course Advanced Hydrogeology covers advanced aspects of hydrogeology and fluid flow in the lithosphere. It focuses on reservoir properties, dynamics of groundwater flow in permeable and fractured rocks, water supply, hydraulic and hydrochemical properties of various rock formations, and applications to geothermal systems. The latter topics provide links to exploitation of geothermal energy or environmental geochemistry.
- b) The course Aqueous Geochemistry focuses on chemical aspects of interaction between water and rock environment. Students are introduced to global hydrogeological cycle,

types of water and other fluids in the lithosphere and their chemical composition, speciation of dissolved substances and chemical equilibria in aqueous solutions as well as interaction of water with silicate, oxide and carbonate minerals. The course closes with composition of surface and groundwater and origin of their solutes during weathering and alteration processes in nature.

Teaching form

- a) lecture and seminar, discussion of results
- b) lecture and practical session

Abbreviations: E – elective, wh – week hours

Learning goals and qualifications

An understanding of the prevailing conditions, such as pressure, temperature and oxygen fugacity, as well as phase equilibria during magmatic and hydrothermal processes, is crucial for deciphering the evolution and formation of igneous rocks in the Earth's interior and at its surface. Moreover, it is important to understand the changes in physical properties of a melt, rock or fluid as a response to static and dynamic prevailing conditions.

In this course students will learn about experimental techniques simulating processes that are essential to the formation of igneous and metamorphic rocks, as well as for hydrothermal environments. Students will be introduced to the design and preparation of experiments and how to process and evaluate experimental run products. Furthermore, the structure and functionality of experimental machines, from 1-atm to ultra-high-pressure devices and low- to high-temperature conditions, will be taught. In addition, methods for controlling and measuring rheology and oxygen-fugacity will be introduced. To apply the theoretical knowledge gained on experimental techniques, case studies will be presented and students will be encouraged to discuss experimental studies.

After attending the course, the students should be able to understand different experimental approaches and their applications within the field. Likewise they should be able to plan and conduct an experimental study in the fields of igneous, metamorphic and hydrothermal geochemistry.

Syllabus

- Introduction
 - Review of magmatic and hydrothermal processes
 - Experimental philosophy and how to prepare an experiment
 - Methods
 - 1-atm experiments
 - High-pressure experiments
-

Fluids in experiments
Hydrothermal experiments
Oxygen fugacity in experiments
Rheometer experiments

- Application
 - Igneous experiments – mafic (crystals/melts/fluids)
 - Igneous experiments – felsic (crystals/melts/fluids)
 - Rheology (melts/crystals)
 - Metamorphic experiments (crystals/fluids)

3.4.2 Chemical Thermodynamics of Geomaterials

Module Coordinator Prof. Dr. D. Dolejš		Lecturers Prof. Dr. D. Dolejš			
Type	Workload 150 h	Credits 5 ECTS	Term SS	Cycle annually	Duration 1 term
Course Chemical Thermodynamics of Geomaterials		Presence 3 wh / 45 h	Private study 105 h		Participants 15

Abbreviations: E – elective, wh – week hours

Learning goals and qualifications

Thermodynamics provides universal basis for understanding stability, equilibria, transformations and reactions of materials. Thermodynamic modeling of phase equilibria, construction of phase diagrams and prediction of element partitioning between phases form basis for interpretation of pressure-temperature paths of metamorphic rocks, for modelling differentiation mechanisms of magmas as well as to design and optimize numerous technological processes such as material syntheses, crystallization, smelting, combustion, fluid extraction etc. This module focuses on thermodynamic properties of solid, liquid and gaseous phases that govern their stability and phase equilibria. We will discuss behavior of solids, melts and fluids at high temperature and pressure, equations of state, thermodynamic datasets for diverse applications and methods for prediction of phase equilibria and phase diagrams.

Syllabus

- Review of thermodynamic laws and functions
- Thermodynamic processes and phase transformations
- Thermal properties of substances
- Pressure-temperature-volume equations of state
- Partial properties and mixing
- Thermodynamic models for mixtures (solid solutions, melts)
- Pressure-temperature-volume models for fluids and gases
- Thermodynamic origin of phase stability and phase diagrams
- Mathematical methods for calculation of phase diagrams

Teaching form

Combination of lectures and practical sessions

Examination form

Achievement of learning goals (unmarked): regular participation in the practical sessions and problem solving exercises

Type	Workload 150 h	Credits 5 ECTS	Term SS	Cycle annually	Duration 1 term
Course Mineral Physics		Presence 4 wh / 60 h	Private study 90 h		Participants 15

Abbreviations: E – elective, wh – week hours

Learning goals and qualifications

Mineral Physics is the study of mineralogical questions through the application of crystallography, condensed matter physics and solid-state chemistry. The goal of this course is understanding how the structure of materials and their physical and chemical properties have a strong connection to large-scale planetary processes. Investigation of thermodynamic and properties of minerals at the atomic scale are crucial to interpret and understand observational data from seismology, geodynamics geochemistry and planetary science. Students in this course will be introduced to different experimental and computational methods to study the structure, phase stability and properties of materials at extreme conditions prevalent in planetary interiors.

Syllabus

Lecture

- High pressure mineralogy (major stable phases in Earth and other planetary bodies)
- Thermodynamics (brief reminder)
- Experimental methods for performing high pressure and high temperature experiments
- Computational methods to study materials under extreme conditions
- Equations of state (static and shock)
- Pressure scales
- Elasticity
- Lattice dynamics
- Defects and their impact on physical properties
- Rheology

Exercises

- Visualize and understand atomic structure of materials
- Focus on data analysis (e.g. matlab or python) of experimental methods
- Writing simple scripts for processing and visualization of data

-
- Processing high-pressure x-ray diffraction data (e.g. LeBail fit and equations of state fits)
 - Performing simple ab-initio and molecular dynamic simulations (abinit)
-

Teaching form

3.4.4 Geothermics and Geothermal Energy

Module Coordinator Prof. Dr. S. Hergarten		Lecturer Prof. Dr. S. Hergarten			
Type	Workload 150 h	Credits 5 ECTS	Term WS	Cycle annual	Duration 1 term
Course Geothermics and Geothermal Energy		Presence 3 wh / 45 h	Private study 105 h		Participants 16

Abbreviations: C – compulsory, E – elective, wh – week hours

Note: This module will probably be replaced by a module offered jointly by the University of Strasbourg, KIT, and University of Freiburg within the Eucor framework from WS 2021/22 on.

Learning goals and qualifications

Despite its great potential, geothermal energy is slowly growing compared to other sources of renewable energy and still poses challenges concerning geology and engineering. In this module the students mainly learn how to

- assess the geothermal potential at a given location and to
- design geothermal systems for different purposes (electricity, heating) with focus on feasibility, economic efficiency and sustainability.

Syllabus

- Basics of heat transport (conduction, advection)
- Earth's thermal field; global and local geothermal potential
- Shallow geothermal systems (downhole heat exchangers, heat collectors)
- Closed deep geothermal systems and their potential for direct heating
- Hydrothermal systems
- Petrothermal systems

Teaching form

Lecture mixed with practical exercises and homework.

Examination form

Achievement of learning goals (unmarked): ---

Examination: homework (computer-based calculations) to be solved during the semester

Prerequisites for attending

The module *Computing in Geosciences* must have been completed.

Usage of the module in other programs
